

STUDENT MENTAL HEALTH DASHBOARD: FINDINGS AND INTERPRETATION

Institution: Torbita Computer Training School, Abuja

Course: Data Analytics

Prepared By: Clement Jonathan

Project Title: Student Mental Health Dashboard

Executive Summary

The dashboard analysis was conducted on a dataset of **101 students** to assess the prevalence of mental health challenges among students. The analysis focused on depression, anxiety, age-group patterns, gender differences, and treatment-seeking behavior.

Key Findings

1. Student Population

The dataset contains information on 101 students, representing the population used for the analysis.

2. Anxiety Prevalence

Approximately **33.7%** of students reported experiencing anxiety. This indicates that roughly one out of every three students experiences anxiety-related challenges, suggesting that anxiety is a significant concern within the student population.

3. Depression Prevalence

Approximately **34.7%** of students reported experiencing depression. The depression rate is slightly higher than the anxiety rate, indicating that depressive symptoms are also common among students.

4. Gender-Based Analysis

The dashboard shows that female students reported higher levels of depression than male students. This suggests that female students may be more vulnerable to emotional and psychological stressors within the learning environment.

5. Age Group Analysis

Students aged **20 years and below** recorded the highest depression count compared with older age groups. This may indicate that younger students experience greater adjustment challenges, academic pressure, or social stress during their early years of study.

6. Treatment-Seeking Behaviour

The treatment chart indicates that only a very small proportion of students sought professional help, while the overwhelming majority did not seek treatment. This finding suggests low utilization of mental health support services despite the presence of depression and anxiety among students.

Interpretation

The results suggest that mental health challenges are common among students. Depression and anxiety affect a substantial proportion of the student population, particularly younger students and female students. The low level of professional help-seeking behavior may indicate stigma, lack of awareness, limited access to services, or reluctance to seek assistance.

Recommendations

- Establish student mental health awareness programs.

- Provide access to counselling and psychological support services.
- Organize regular mental health screening and wellness campaigns.
- Encourage early intervention for students showing signs of anxiety or depression.
- Develop peer-support initiatives and student mentorship programs.

Conclusion

The dashboard demonstrates that mental health is an important issue among students. With depression and anxiety affecting a considerable proportion of the student population and treatment-seeking behavior remaining low, educational institutions should prioritize mental health support and awareness initiatives to improve student well-being and academic success.
